PROJECTS

Recipe Picker - [GitHub](#)

- I worked with a team to help build a web application that would help users pick recipes for meals that they had ingredients for. We used a third-party API to help find the recipes for the user and have the users save their recipes to their accounts.
- My role in this project was to do the front end, more specifically what I did in this project was build and design the pages for our app while I had my other partner in the front end style the page with CSS. I also helped to create the routes for each page and some saving functionality for the recipes for each user.

My Music Box - [GitHub](#)

- My Music Box is a MERN stack web application that allows users to search for music, favorite songs, and comment on songs. We used a third-party API to look for music so that users could see their favorite artist's music come up when they search for their names or songs.
- I handled using a new CSS library inside an NPM package with React and helped to design and build the pages in our project.

Social Network API - [GitHub](#)

- This project is built on the use of MongoDB, which in this case, was able to showcase a social network application.
- In this application, a new user can be created to add other users to the database. All users can make or remove thoughts, friends, and/or reactions.

E-Commerce Backend - [GitHub](#)

- Built a backend application with the use of MySQL for an E-Commerce Site. This application allows the user to use GET routes to search for all categories, products, and tags.
- As the user, you are also able to update a category, product, and tag using its specific ID for its classification.
- The user is also able to create or delete their own categories, products, or tags using the ID for its classification.

Weather Dashboard - [GitHub](#)

- This application is used to show the user the weather forecast for the area they have decided to look up in the search bar.
- The user will be presented with multiple cards that show the weather for the current day as well as the weather forecast for the next five days.

Password Generator - [GitHub](#)

- In this project, a user can generate a random password off of the user's password preferences.
- When the user clicks to generate a new password, the code will then ask the user what kind of characters they would like in their password.
- After getting the user's input, the code will then filter out what the user did not want and will output a newly, generated random password for the user.

EDUCATION

Graduated 07/2023
Lake City, Utah

Full Stack Developer Certificate, University of Utah - Salt
